

December 2019

November 2020

May 2021

Martin et al., 2021, Cell 184, 5189–5200 The emerging and evolving SARS-CoV-2 N501Y lineage

March 2021

E to K associated positive selection
signal detectable even when only
considering alpha sequences

June 2021

K more than doubles in frequency between March and June 2021, reiterating that K
provides a fitness advantage: K at this site is added to the 501Y meta-signature
along with various mutations at 34 other similarly evolving genome sites

Used data up to February to define 34 convergent sites between three N501Y lineages

Used data up to June to validate convergent sites

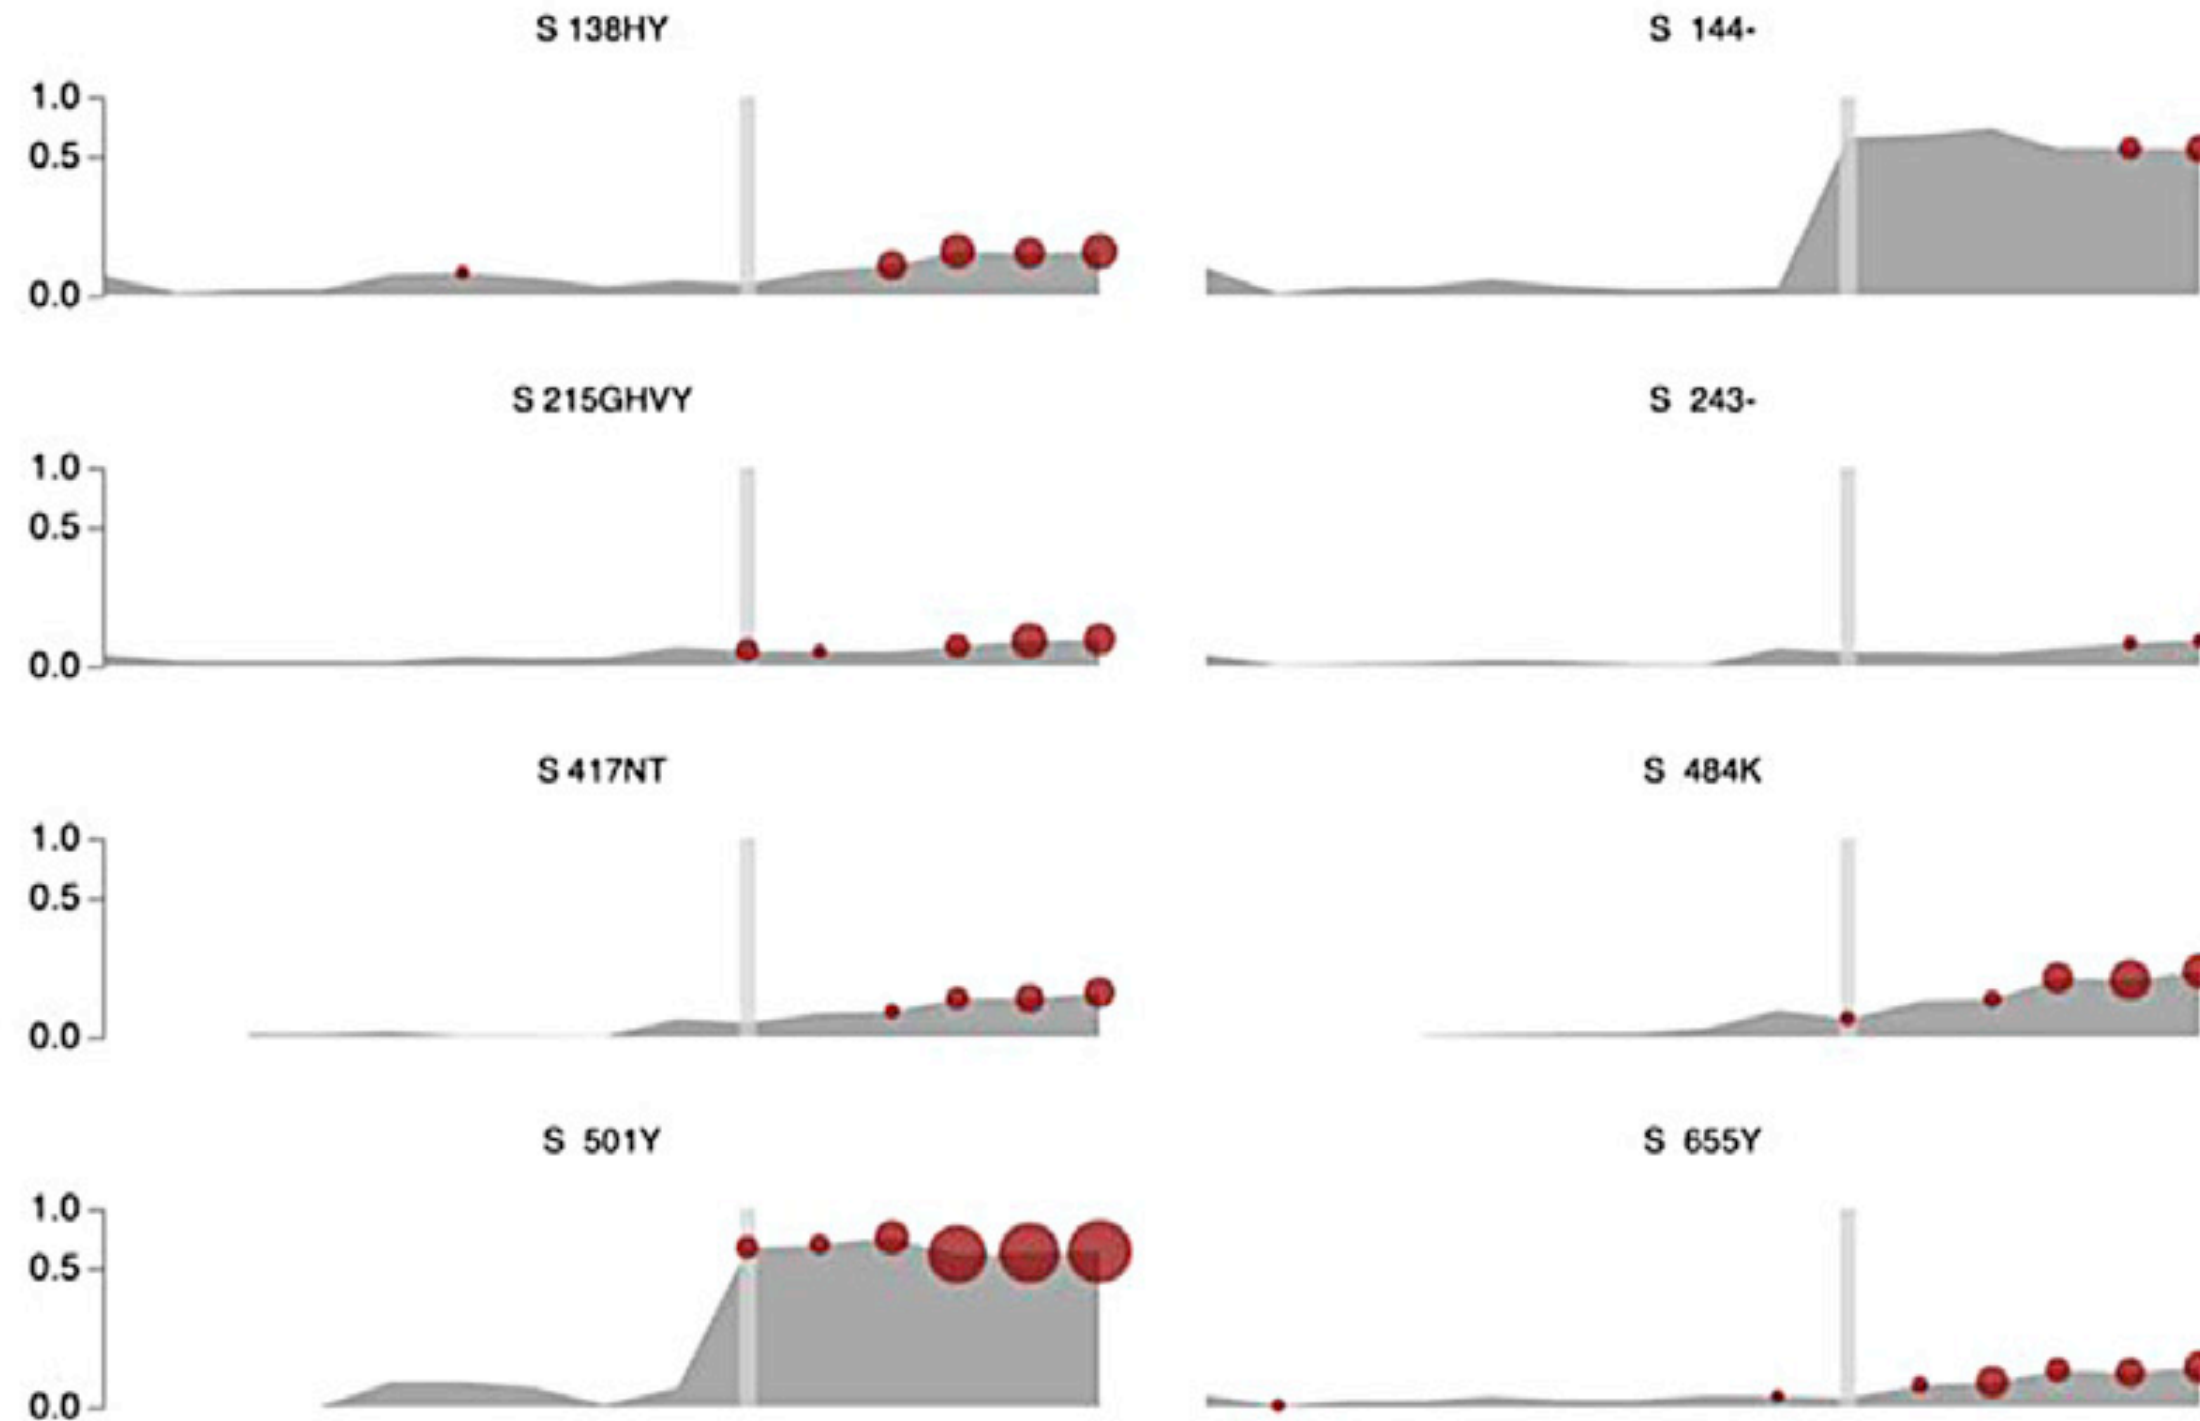

Evolutionary Probability

Nucleotide	Site	V1	V2	V3	V1 subs to	V2 subs to	V3 subs to
21574	S/5	✕✕	✕✕	✕✕	F	F	F
21613	S/18	✕✕	~✕✕	~✕✕	F	F	F
21619	S/20			~+		T I	N

Selection legend

1. ~ : Signature mutation
2. + : MEME support
3. ✕✕ : convergent substitutions to another lineage (no MEME support)
4. ✕✕ : convergent substitutions to another lineage AND MEME support

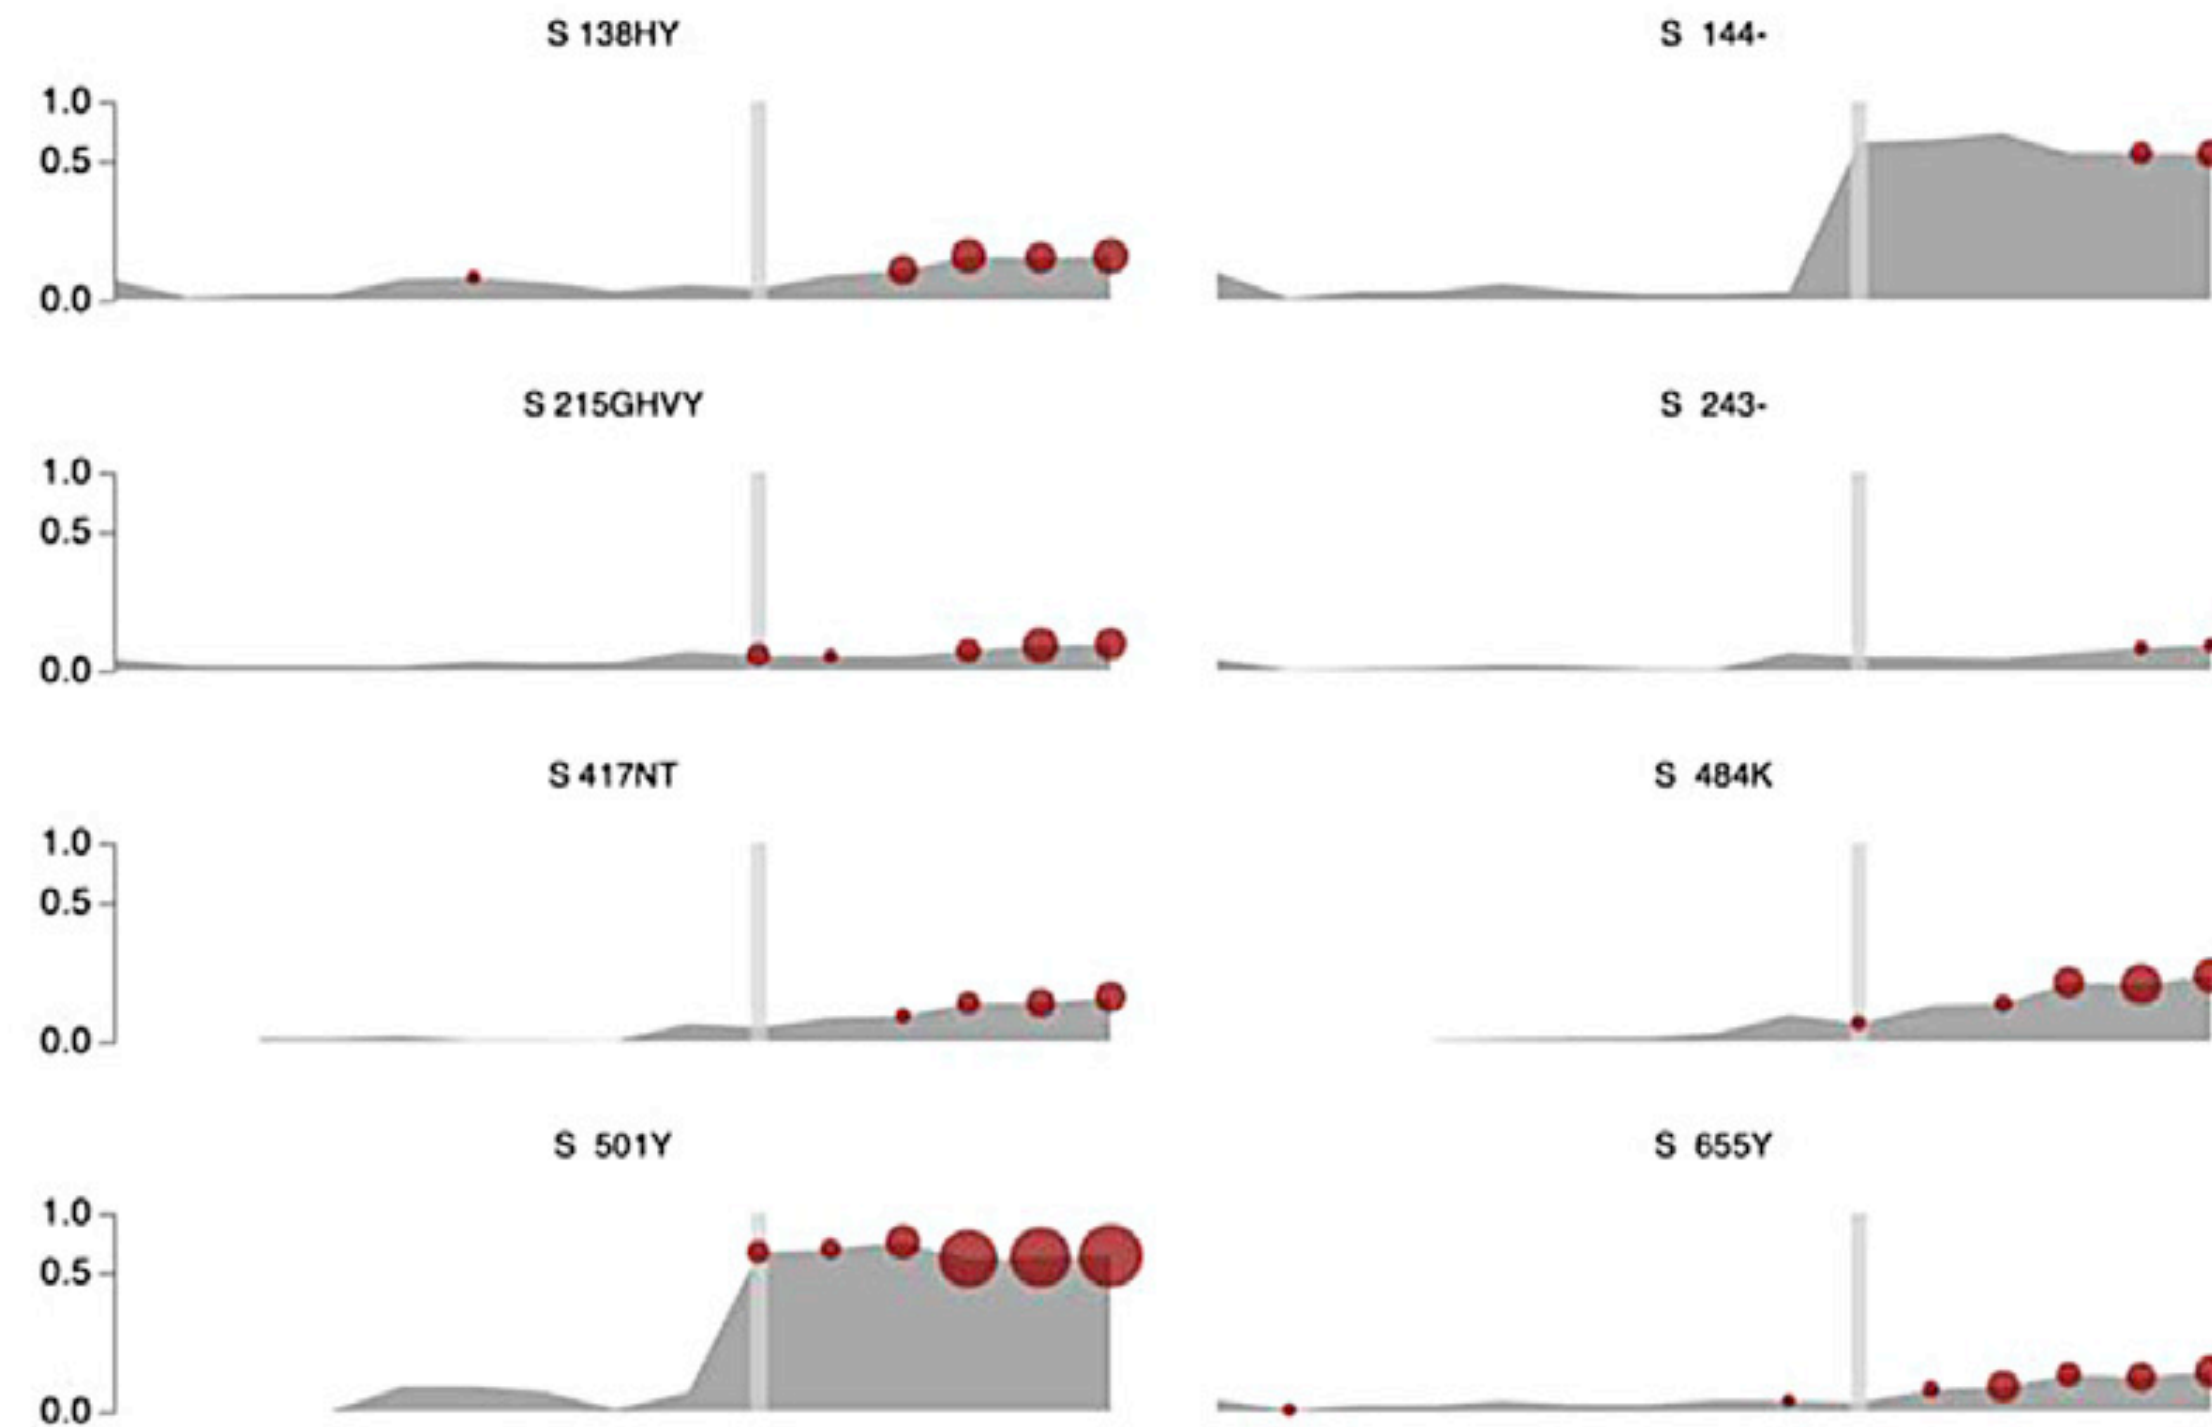

“In total, 20/47 of the analyzed convergent mutations that were suggested by our global and lineage-specific positive selection analyses to have contributed to the fitness of 501Y lineage viruses prior to March 2021 more than doubled in frequency in at least one of the lineages between 15 March and June 1, 2021”
